WEARING GLOVES OUTSIDE THE LABORATORY

Everyone at UCSF plays an active role in minimizing cross-contamination outside the laboratories. Protective gloves must not be worn in public areas outside of the laboratory (e.g., corridors, elevators, offices). Gloves should be removed prior to touching any surfaces or equipment that can result in cross-contamination (e.g., door knobs, telephones, computer work stations, etc.).

THE ONE GLOVE RULE: If you transport hazardous materials, use an ungloved hand to touch common surfaces and a gloved hand to carry the hazardous items.
